Photoshop provides a variety of effects—such as shadows, glows, and bevels—that change the appearance of a layer's contents in a non-distructive way. Layer effects are linked to the layer contents. When you move or edit the contents of the layer, the same effects are applied to the modified contents.

For example, if you apply a drop shadow to a text layer and then add new text, the shadow is added automatically to the new text.

A layer style is one or more effects applied to a layer or layer group. You can apply one of the preset styles provided with Photoshop or create a custom style using the Layer Style dialog box.

# HOW DOES IT WORK

#### Specify a tonal range for blending layers

The sliders in the Blending Options dialog box control which pixels from the active layer and the underlying visible layers appear in the final image. For example, you can drop dark pixels out of the active layer or force bright pixels from the underlying layers to show through. You can also define a range of partially blended pixels to produce a smooth transition between blended and unblended areas.

Double-click a layer thumbnail, choose Layer > Layer Style > Blending Options, or choose Add A Layer Style > Blending Options from the Layers panel menu.

#### Note:

To view blending options for a text layer, choose Layer > Layer Style > Blending Options, or choose Blending Options from the Add A Layer Style button at the bottom of the Layers panel menu.

In the Advanced Blending area of the Layer Style dialog box, choose an option from the Blend If pop-up menu.

- Choose Gray to specify a blending range for all channels.
- Select an individual color channel (for example, red, green, or blue in an RGB image) to specify blending
  in that channel.

Use the This Layer and Underlying Layer sliders to set the brightness range of the blended pixels—measured on a scale from 0 (black) to 255 (white). Drag the white slider to set the high value of the range. Drag the black slider to set the low value of the range.

#### Note:

To define a range of partially blended pixels, hold down Alt (Windows) or Option (Mac OS), and drag one half of a slider triangle. The two values that appear above the divided slider indicate the partial blending range.

Keep the following guidelines in mind when specifying blending ranges:

- Use the This Layer sliders to specify the range of pixels on the active layer that will blend, and therefore
  appear, in the final image. For example, if you drag the white slider to 235, pixels with brightness values
  higher than 235 will remain unblended and will be excluded from the final image.
- Use the Underlying Layer sliders to specify the range of pixels in the underlying visible layers that will blend in the final image. Blended pixels are combined with pixels in the active layer to produce composite pixels, whereas unblended pixels show through overlying areas of the active layer. For example, if you drag the black slider to 19, pixels with brightness values lower than 19 will remain unblended and will show through the active layer in the final image.

#### **BLEND IF FOR QUICK EFFECTS**

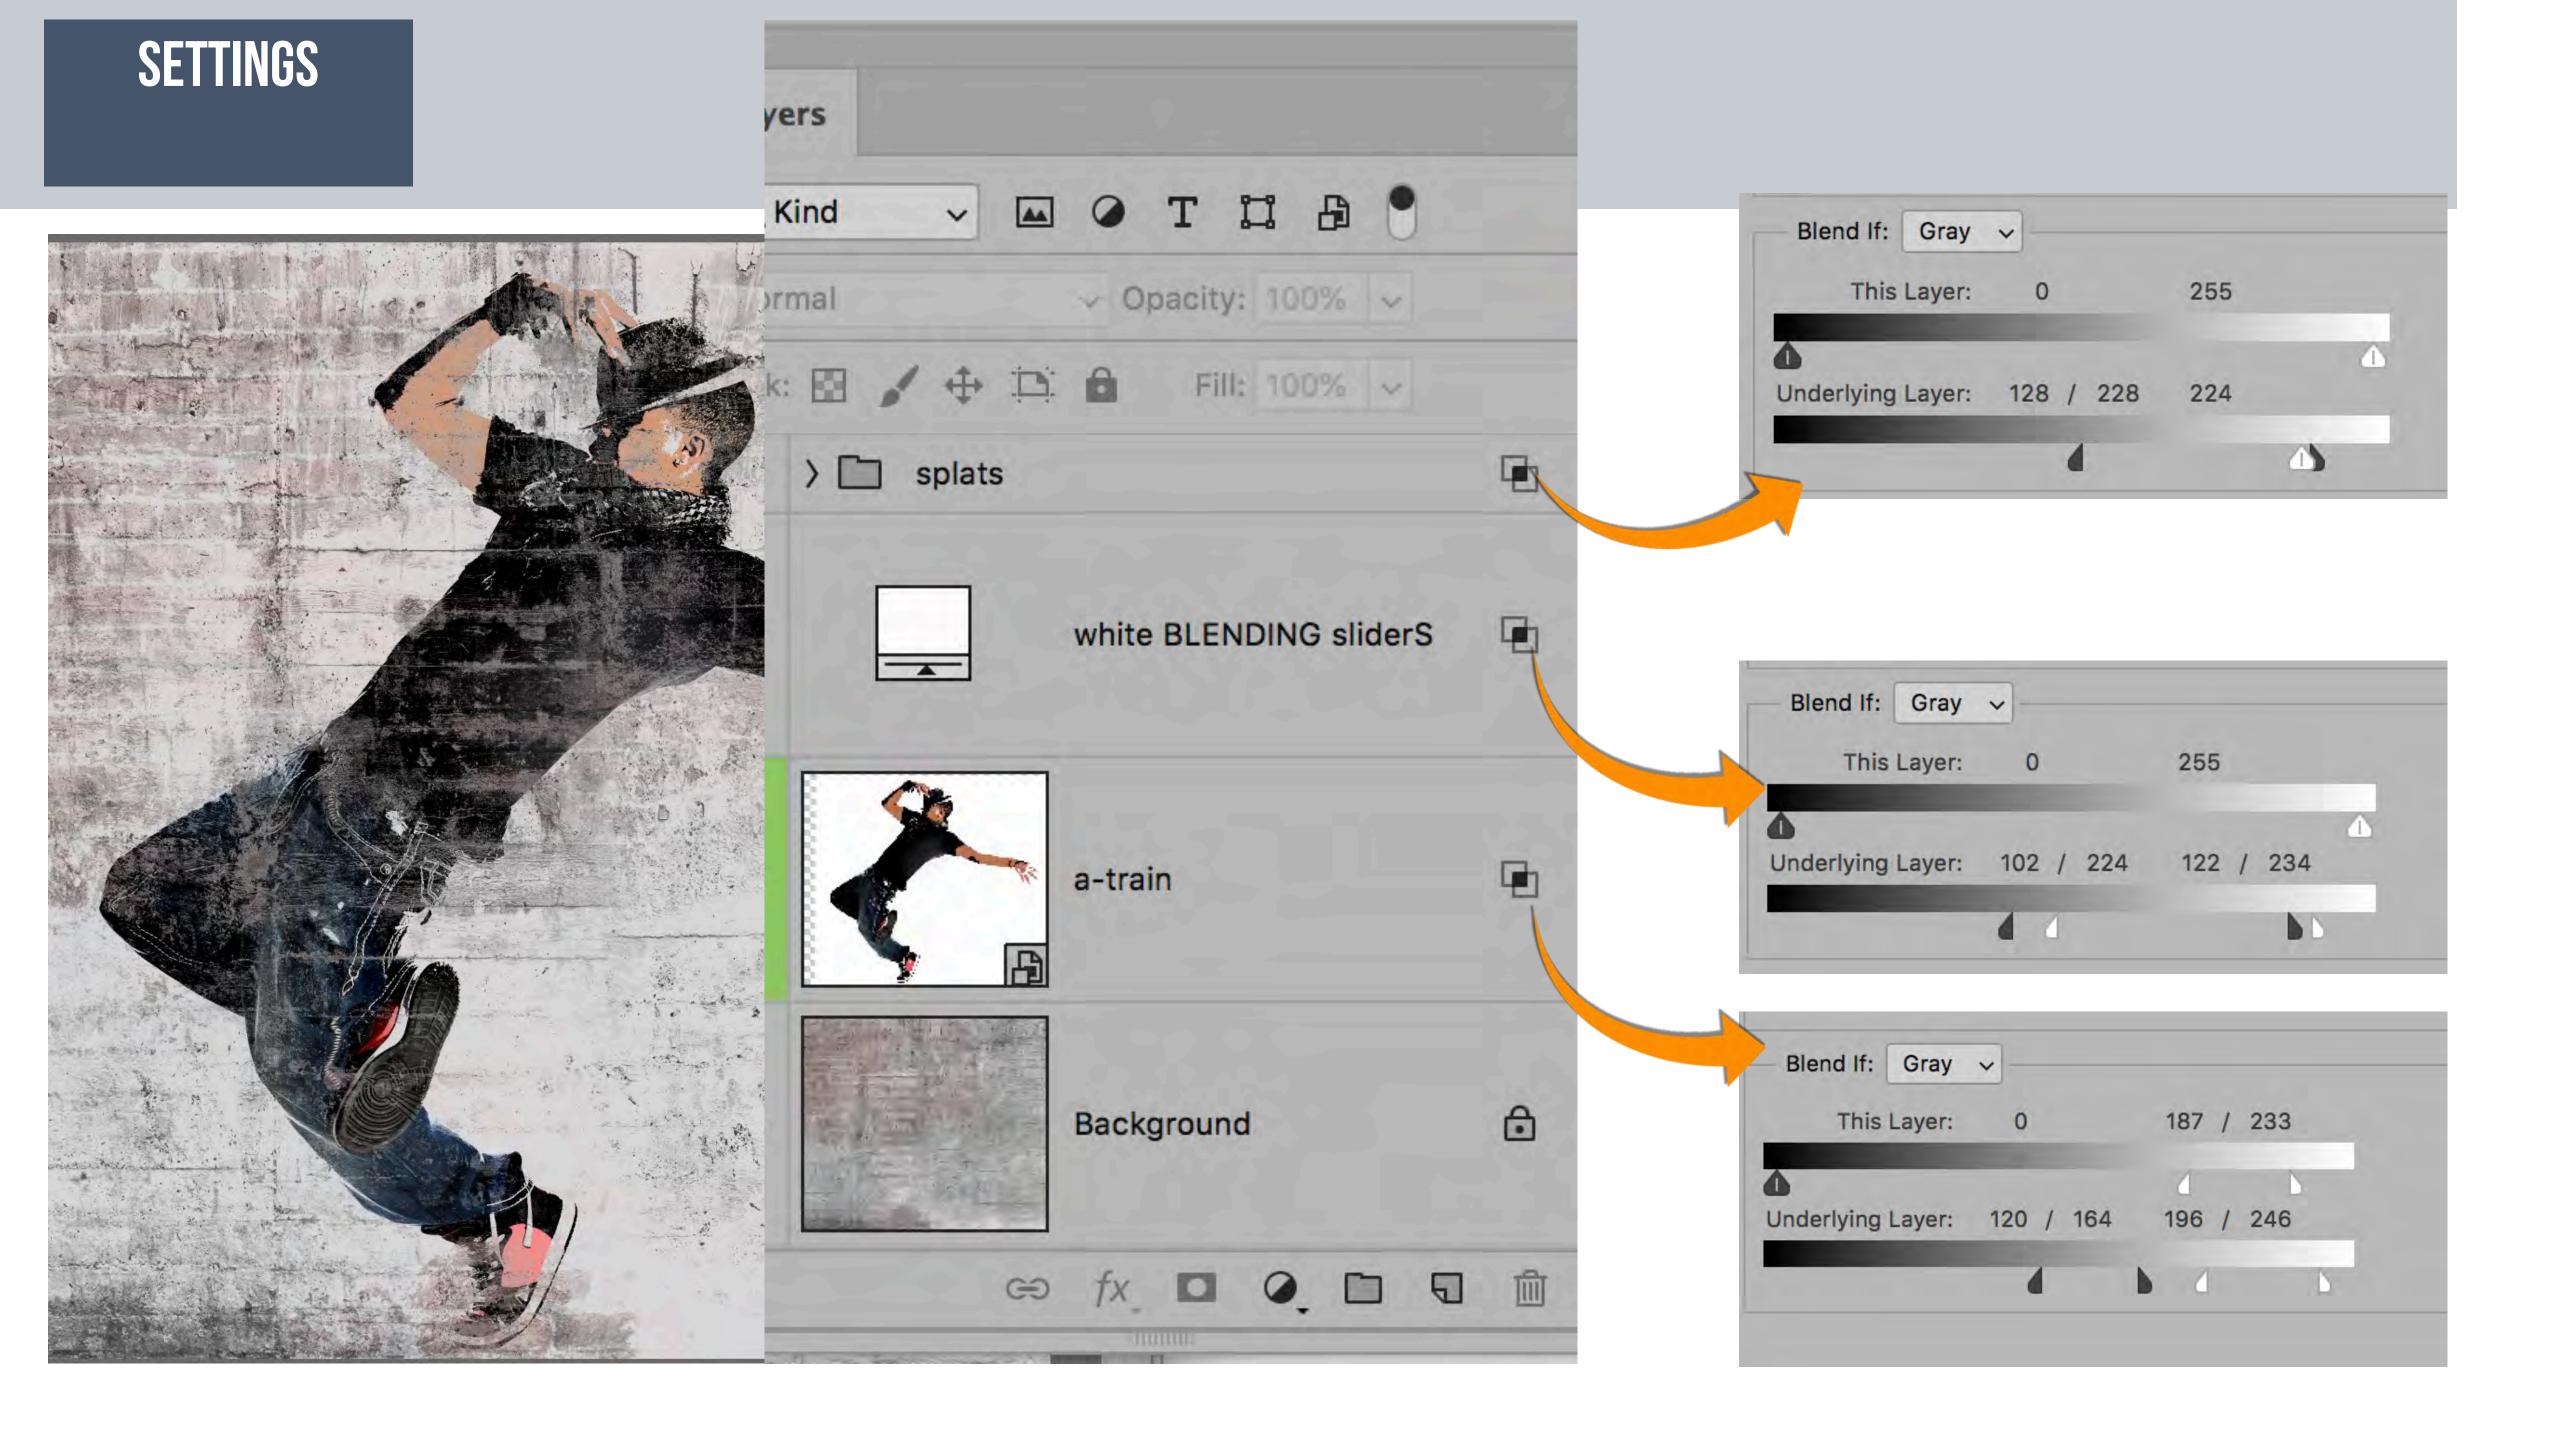

#### **SPECIAL EFFECTS**

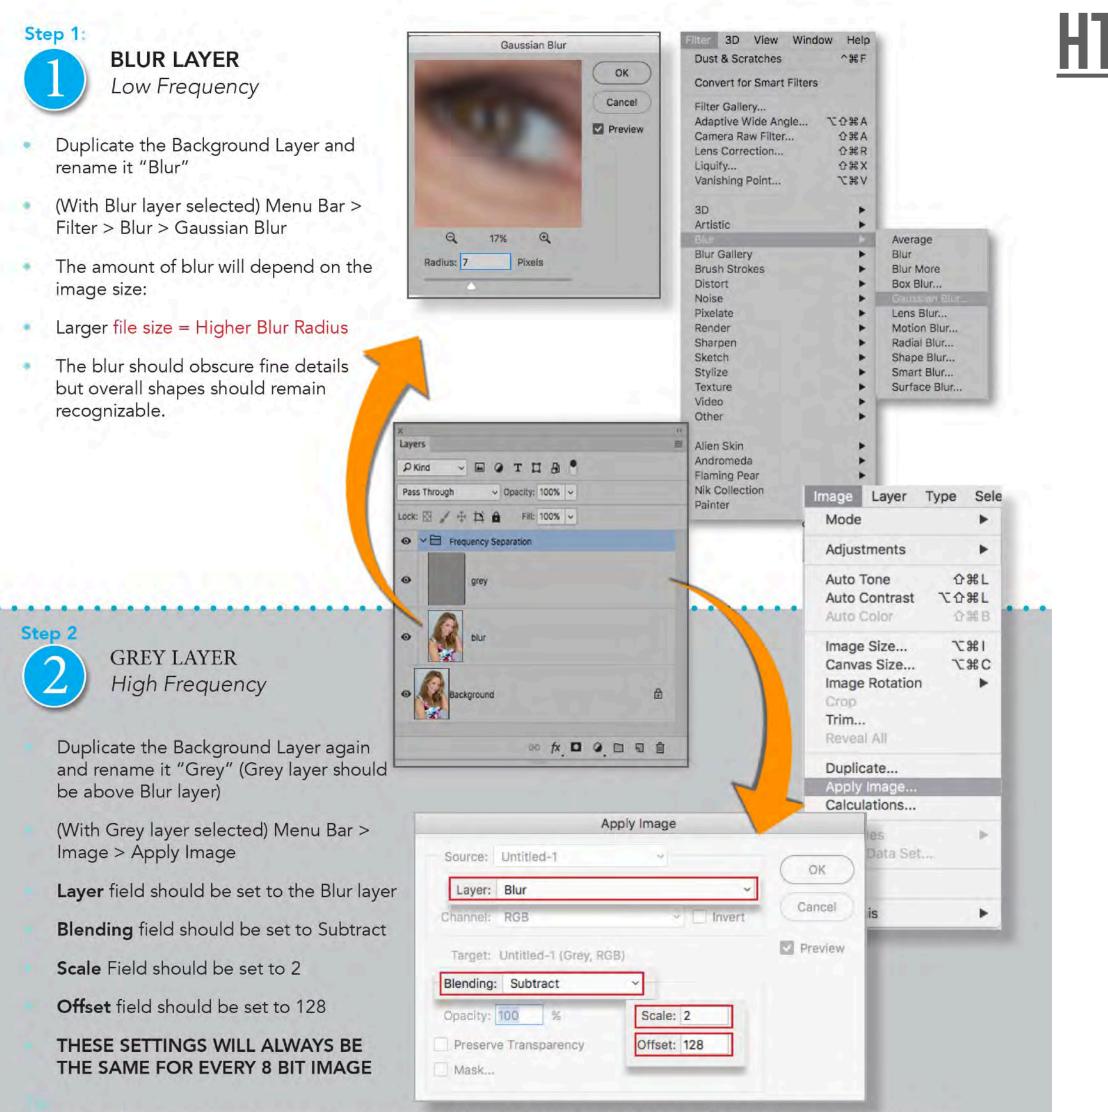

SKIN

#### ► QUICK VIEW: Basic Recipe

Because the frequency separation recipe never changes, it is useful to create a Photoshop action that will automatically create your layers and apply the correct values for you. This can be a big time saver. **BUT** we recommend that you do it by hand enough times in the beginning so that you fully understand the process before you start relying on an action.

#### **FREQUENCY SEPARATION- BASIC** HTTPS://WWW.LISACARNEY.COM/BASIC-FREQUENCY-SEP

#### ADDING SKIN TEXTURE WITH PATTERNS

#### **1. LOADING PATTERNS**

- 2. In **Photoshop** open the **Patterns** Panel (Window > **Patterns**)
- 3. Open the fly-out menu and choose Import Patterns... from the list.
- 4. Locate your . pat file on your hard drive.

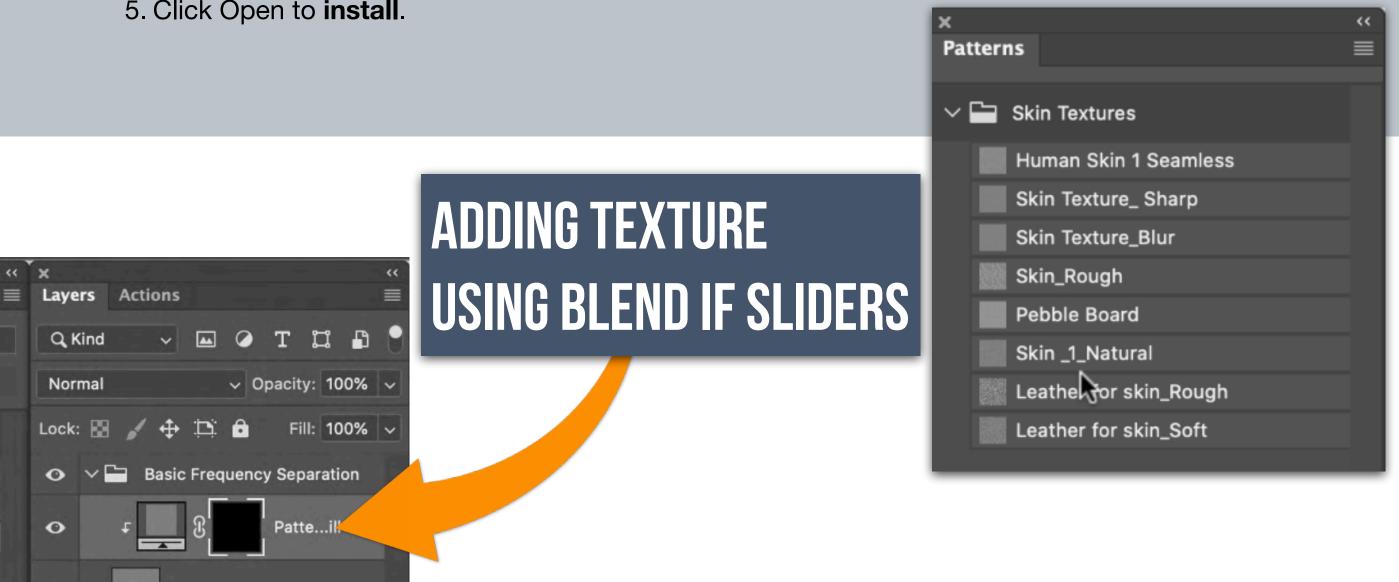

ð

5. Click Open to install.
